

Calm Space

Social Media Addiction & Student Conflicts

Survey Insights Q1 2025

“High screen time, low sleep, higher conflict risk.”

Calm Space

Summary Executive

1 Problem

Within 6 months, Calm Space aims to cut student conflicts from social media by 15% by improving sleep (+30 minutes) and reducing anxiety

3 Key Metrics

Avg_Daily_Usage_Hours, Sleep_Hours_Per_Night, Conflicts_Over_Social_Media, Mental_Health_Score.

5 Findings

Student have high prevalence of conflict and Lack of sleep & anxiety

2 Objective

To cut student conflicts from social media by 15% by improving sleep (+30 minutes) and reducing anxiety in Q2 2025

4 Tools

Google Slide, Python, Tableau

6 Recommendation

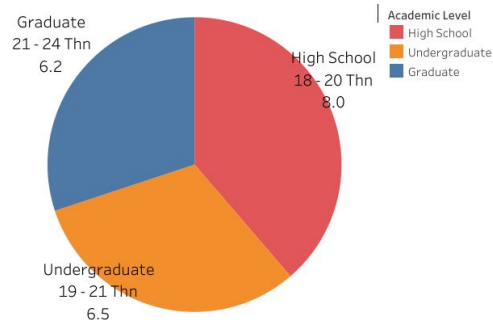

To deploy strategic to take action in Q2 2025.

Calm Space

Industry Model & Business Processes

An **B2B SaaS EdTech company** focuses on student well-being and engagement through a platform that monitors social media usage, sleep patterns, and potential conflicts. The platform also provides data-driven interventions to support mental health and academic performance.

Primary revenue comes from annual licenses offered and additional revenue through professional consulting and premium analytics packages.

Calm Space

Business Problem & Objective

> *Business Problem*

“**Within 6 months**, Calm Space aims to reduce incidents of interpersonal conflict among students due to **excessive social media use by 15%**, by increasing average **sleep quality by more than 30 minutes** per night and **lowering self-reported anxiety levels.**”

> *Project Scope*

Focus on screen time, sleep, conflict, mental health student.

> *Objective*

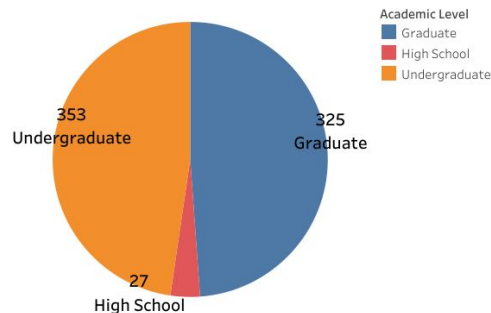

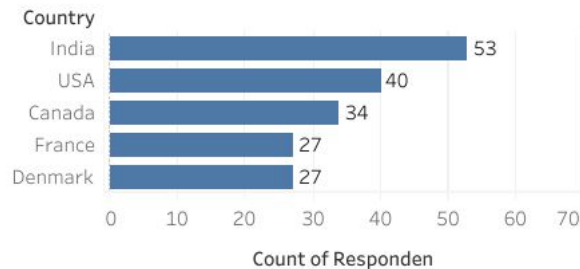

- ⚡ **Reduce interpersonal conflicts down 15%.**
- 😓 **Increase average sleep +30 minutes/night.**
- 😞 **Lower self-reported anxiety levels.**

Calm Space

Dataset Overview

1. Source: [Kaggle](#) survey dataset (705 respondents, 5 continents, 101 Country).
2. **Demographic coverage:** High school, undergraduate, graduate students.
3. Key Metrics variables:
 - **Screen Time** (daily usage, platform, addiction score).
 - **Sleep** (hours/night).
 - **Mental Health** (anxiety/score).
 - **Conflicts** (relationship & social conflict reports).
4. Note: Data is **cross-sectional & survey-based** (not causal).

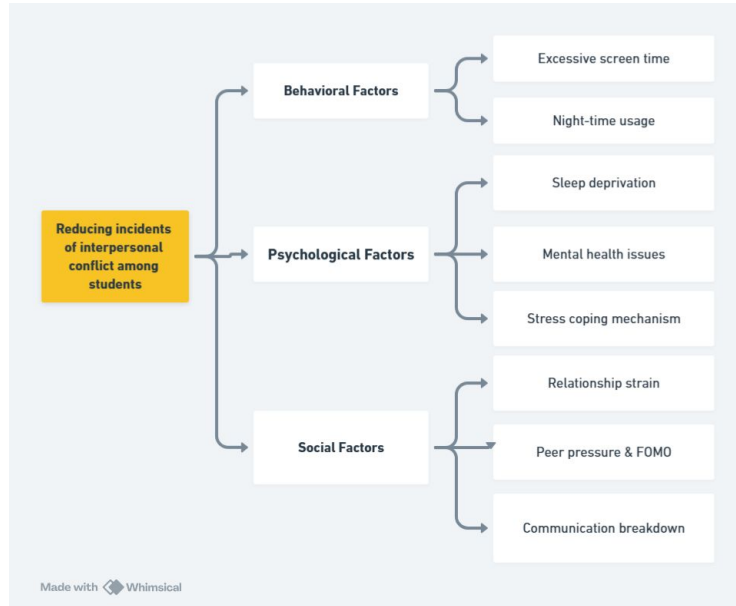

Responden / Country

Calm Space

Analysis Framework

> Root Causes Analysis

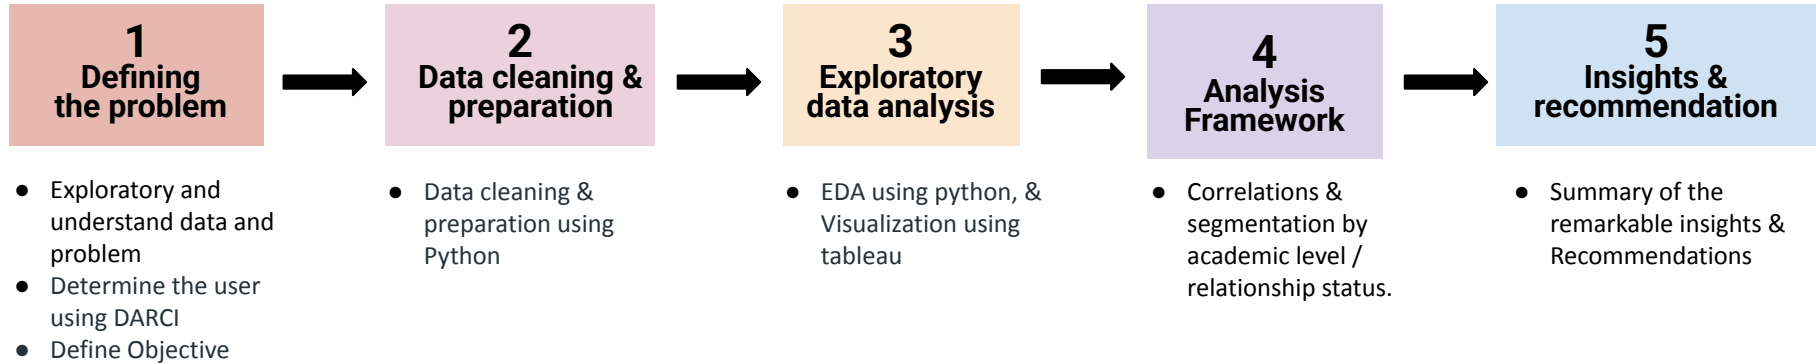

> Hypothesis

1. **Student** who **use social media more than 5 hours/day** have **risk of interpersonal conflict that is twice as high** as student who use social media for **less than 3 hours/day**.
2. **Students** who **sleep less than 6 hours/day** tend to have anxiety/depression scores that are **25% higher than** those who sleep **7 hours or more per day**.
3. The **Combination high screen time (>5hours/day) & short sleep (<6hours/day) increases risk of interpersonality conflict 2 times** compared with low screen time & enough sleep.

Calm Space

Methodology

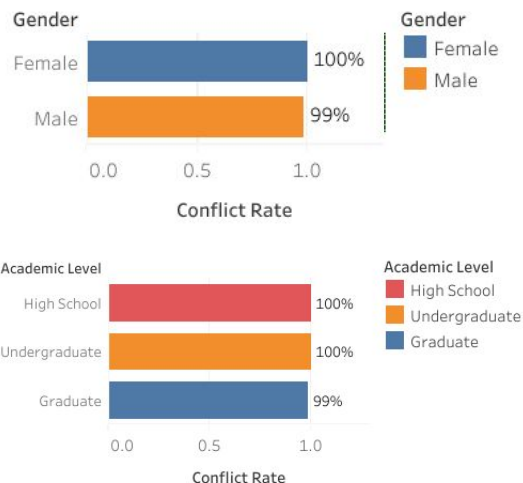

Calm Space

Conflict is Systematic

> *Conflict: A Systematic Issue*

1. **Almost all students** reported **conflicts** due to social media.
2. **Not linked to gender** (male vs female similar conflict rates).
3. Education level: **graduate** students **slightly better**, but conflict still significant.

"Conflict is widespread, not isolated."

Calm Space

Sleep as a Key Mediator

*“The World Health Organization (**WHO**) **does not specify a particular** “international sleep time,” but **recommends** different sleep durations for different age groups. For adults (**18–64 years old**), **7–9 hours** of sleep per night is recommended, while adolescents (14–17 years old) need 8–10 hours of sleep. Less than these durations can have a negative impact on health and daily performance.”*

[nhlbi - 2022](#)

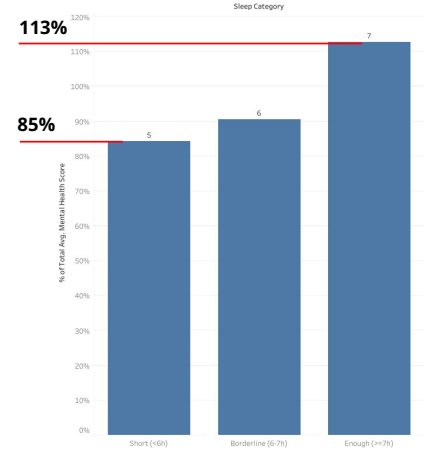

Calm Space

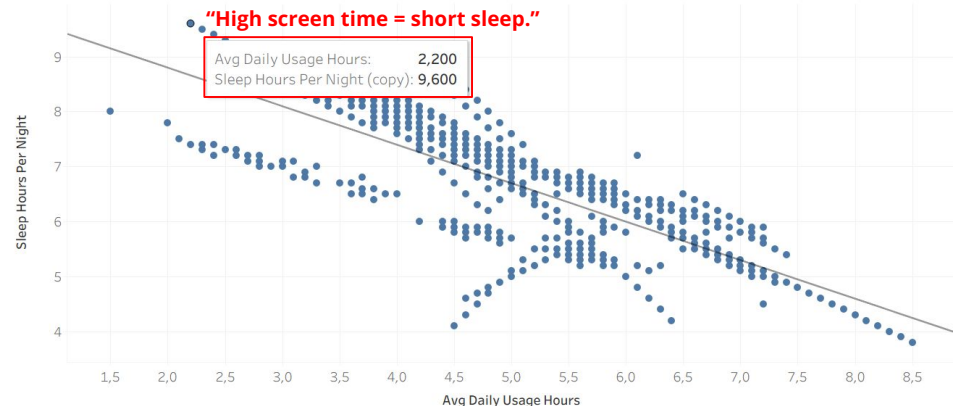

Sleep as a Key Mediator

> Sleep Duration & Mental Health

1. <6 hours of sleep is **associated** with the **lowest mental health scores** (-85%).
2. 7 hours of sleep **supports better health** (+113%).
3. A **clear negative correlation**: the more time spent in front of a screen, the less sleep.

Correlate Daily Usage vs Sleep Hours

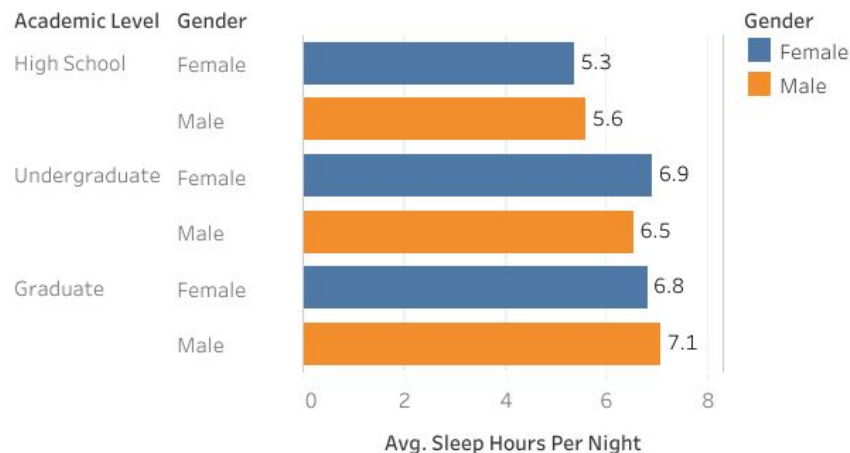

Calm Space

Sleep as a Key Mediator

> *Sleep Duration Sleep Duration based on academic performance*

1. There is an **pattern increase** in hours of sleep as the level of education increases.
2. **High school students** show the highest potential for sleep deprivation, sleeping less than 6 hours.
3. **Graduate** students have the highest average number of hours of sleep, with males sleeping slightly longer than females.

Calm Space

Duration Screen time Usage

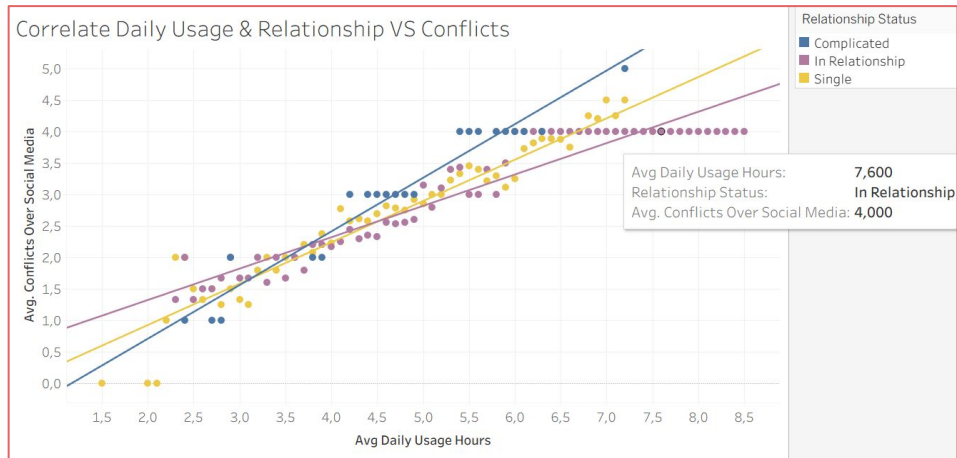

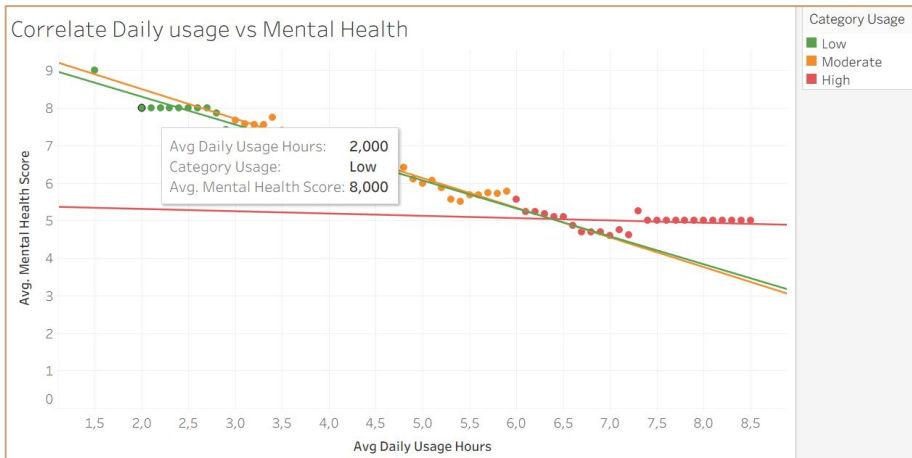

*"The average screen time for adults (aged **16 to 64**)
is **6 hours and 37 minutes** per day."*

[Digital Report 2023](#)

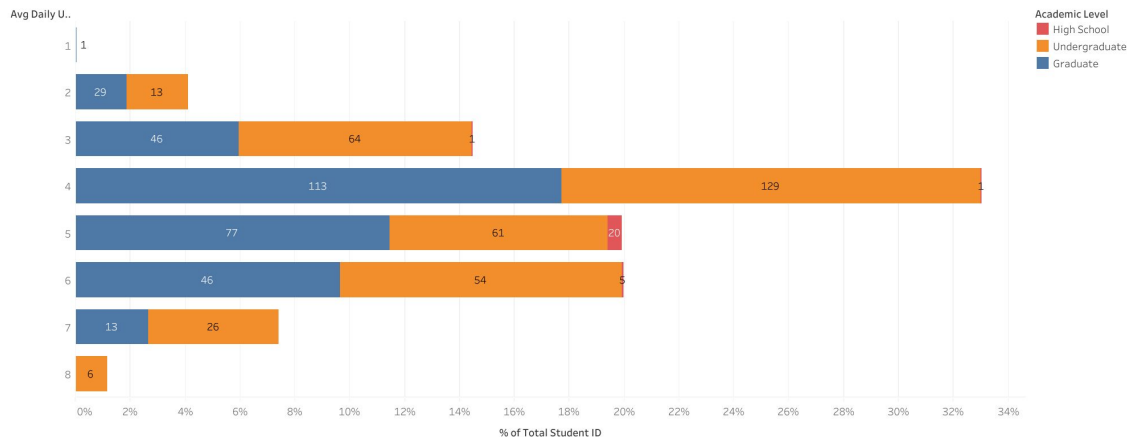

Calm Space

Duration Screen time Usage

Calm Space

Duration Screen time Usage

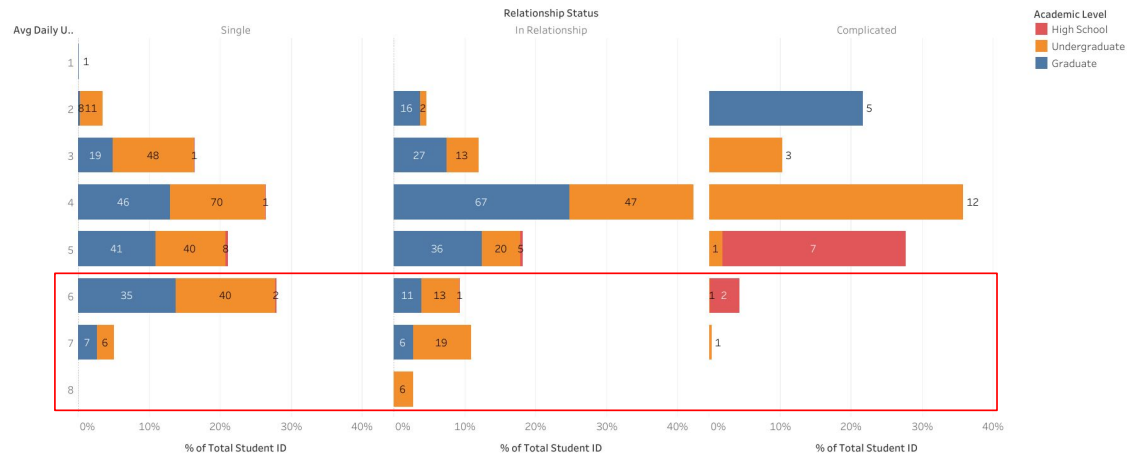

> *Daily Usage per Academic*

1. **Dominate** usage for **4-6 hours per day**.
2. **Undergraduates most intensively** on a daily basis, with some even **reaching 8 hours per day**.
3. **Graduate** students are **relatively balanced** (3-6 hours) and rarely exceed 7 hours per day.
4. **High school** students use social media less, but still **significantly**, up to 5 hours per day.

Calm Space

Who is Most at Risk?

> High-Risk Student Groups

1. **Undergraduates** are heaviest users (4–8h/day).
2. **Single/Complicated status** more extreme screen time.
3. **Moderate users (3–5h/day)** paradoxically most conflict-prone (more active interactions).

"Undergraduates (single/complicated) are **most vulnerable**."

Calm Space

Segmentation Mental Health

> *level of anxiety based on age*

1. The average mental health score of respondents was in the medium category.
2. The highest mental health score was among those aged 22, and the lowest was among those aged 18–20.
3. As age increased, mental health scores also increased.

Calm Space

Segmentation Mental Health

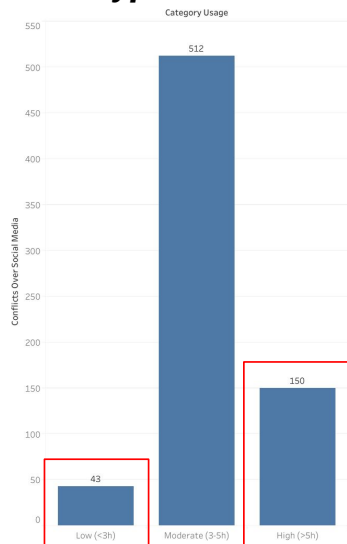

> level of anxiety based on Gender & Academic

1. Women tend to have higher scores than men, except at the undergraduate level.
2. High levels of anxiety were seen at all levels of education, especially at the undergraduate and graduate levels.
3. There were few high school respondents, but those who reported high scores reached 7.0–7.1.

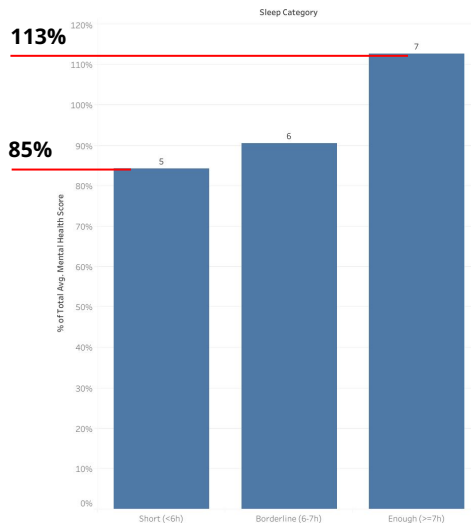

Calm Space

Hypotheses Validated

> Hypotheses Confirmed by Data

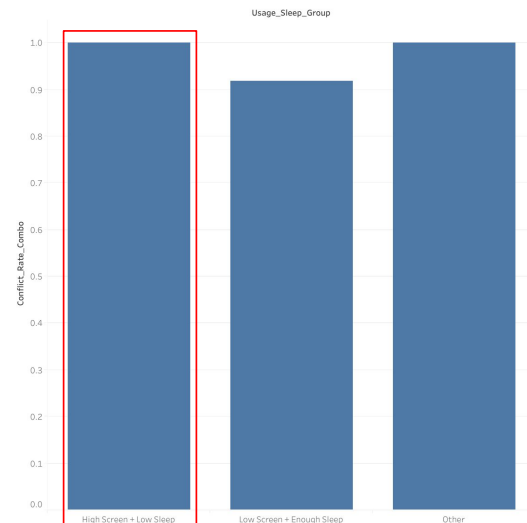

High Students using >5h/day (150)
2x higher conflict risk vs <3h/day (43).

Students sleeping <6h/night
25% higher anxiety vs ≥7h .

Screen Time & Sleep vs Conflicts

Combination (>5h Timescreen + <6h sleep) 2x conflict risk vs balanced group.

Calm Space

Business Insight

> *Business Impact: Why This Matters*

High prevalence of conflict

risk of decline in academic achievement and student welfare.

Lack of sleep & anxiety

increased need for counseling services (increased institutional costs).

Undergraduate students are vulnerable

main target of Calm Space (potential market & early intervention).

If left unaddressed

school/university reputation may decline (dropouts, exhaustion, complaints).

Calm Space

Strategic Recommendations (Q2 2025)

> *Strategic Actions for Q2 2025*

Focus: reduce student conflicts by **15%** through better sleep & screen time balance.

Target Group: Undergraduates with **single/complicated** relationship status = most at risk.

Actions:

- Launch **Sleep First Campaign** to encourage +30 min average sleep.
- Deploy **Gamified Digital Detox Challenge** (reward for <5h/day).
- Provide **Institutional Wellness Dashboards** to school boards/universities.

Expected KPI Impact: Conflict down 15%, Sleep +30 min, Anxiety down 10%.

Calm Space

Summary Insight & Recommendation

> *Strategic Actions for Q2 2025*

Objective, Reduce student conflicts by 15% in 6 months by improving sleep (+30 min/night) and reducing anxiety.

B (Business Problem)	P (Insight Summary)	I (Recommendation – Detailed & Actionable)	R (Priority Level)
Students show high conflict prevalence linked with excessive screen time and poor sleep.	Conflicts are systematic (seen across gender & education level), with undergraduates most vulnerable.	🎯 Target undergraduates with “single/complicated” status through digital wellness programs (screen time balance, sleep campaign).	● High
Excessive screen time (>5h/day) doubles conflict risk.	Undergraduates dominate usage (4-8h/day). Moderate users (3-5h/day) most conflict-prone due to active interactions.	⚡ Launch Gamified Digital Detox Challenge to reward <5h/day usage; integrate screen time tracker in Calm Space app.	● High
Poor sleep (<6h/day) raises anxiety/depression by 25%.	High school students most at risk of sleep deprivation (<6h), graduate students have better patterns.	🌙 Deploy Sleep First Campaign: nudges for 7h sleep, bedtime reminders, sleep score dashboard for schools.	● Medium

Calm Space

Summary Insight & Recommendation

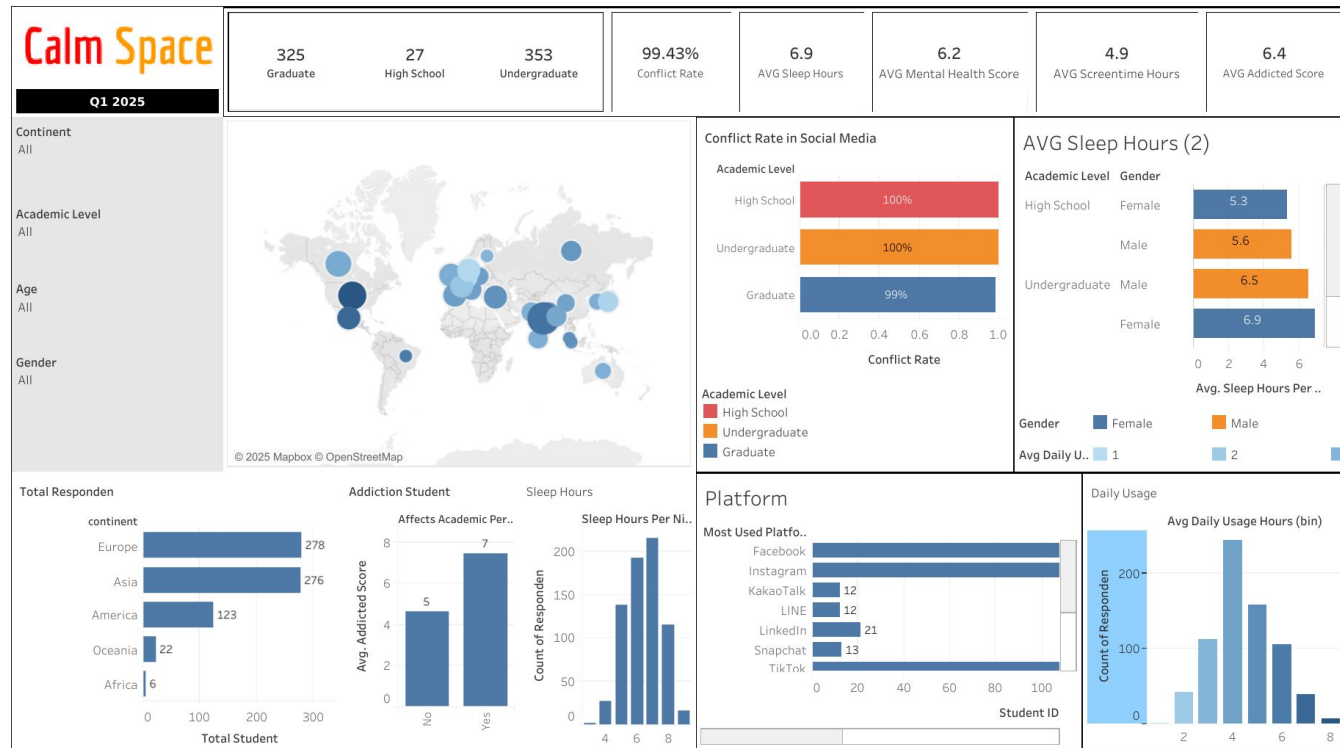

> *Strategic Actions for Q2 2025*

Objective, Reduce student conflicts by 15% in 6 months by improving sleep (+30 min/night) and reducing anxiety.

B (Business Problem)	P (Insight Summary)	I (Recommendation – Detailed & Actionable)	R (Priority Level)
Combined high screen time + poor sleep doubles conflict risk.	Groups with irregular patterns are most vulnerable to conflict.	🧩 Build Conflict Risk Score Model combining screen time + sleep alerts for at-risk students.	● High
Anxiety levels remain high across education levels, especially undergraduate & graduate.	Women slightly higher scores, except undergrad; mental health lowest at age 18–20.	👩🏫 Partner with psychologists & schools to run micro-courses on stress management, healthy digital interaction, targeting 18–22 age.	● Medium
Country variation: US & India high usage, but conflict also high in Bangladesh & Pakistan even at lower usage.	Conflict not linear with usage; cultural/contextual factors matter.	🌐 Expand Calm Space B2B offering to universities in high-conflict regions, tailor interventions per region.	● Low (longer-term)

APPENDIX

Link Python

Correlation

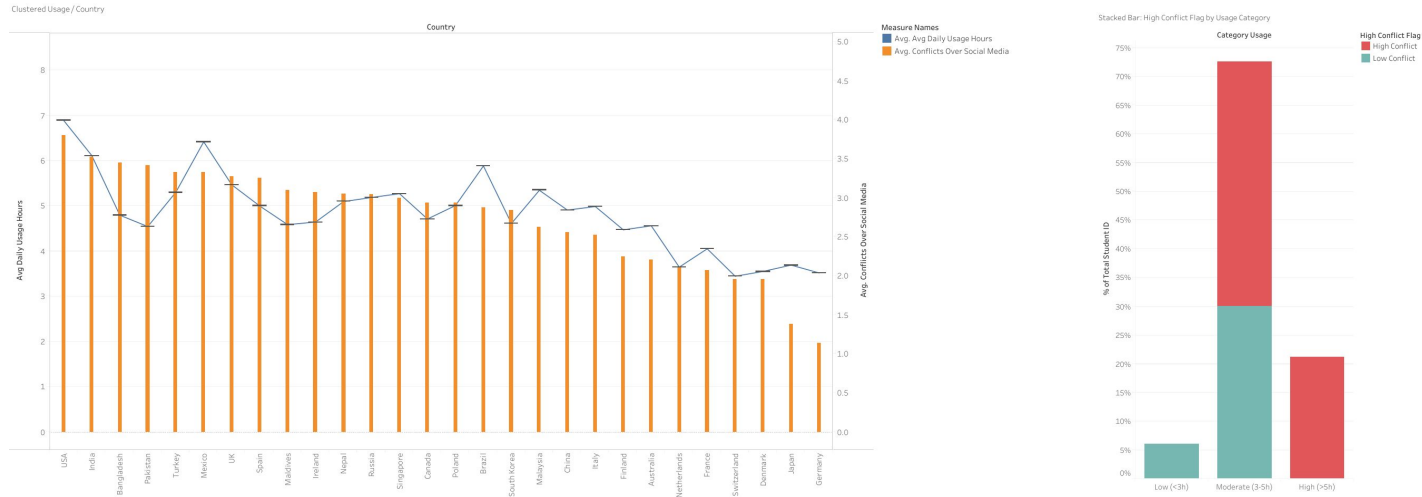

1. Excessive social media use (more than 5 hours/day) is **strongly correlated with poorer mental health**.
2. The most significant impact is seen among **low** and **moderate** users, while **high** users are already at a low point and do not deteriorate much further.

1. Positive correlation: the higher the daily use of social media, the higher the conflict on social media
2. Relationship status is related to this correlation, with the highest conflict occurring among those with a **“Complicated”** status, followed by **“Single,”** and the lowest among those **“in a relationship”**.

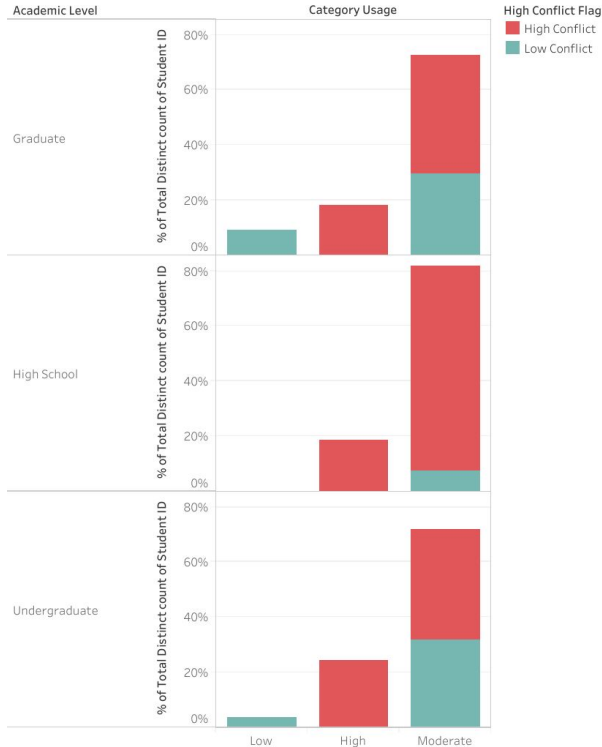

Results Average Daily Usage per Country

1. **The USA and India** have the highest daily social media usage (>6 hours/day), but high usage **does not always correlate linearly with conflict**.
2. For example, Bangladesh and Pakistan have relatively lower usage hours than the USA, but the resulting conflict is quite high.
3. The majority of interactions on social media trigger high conflict (>3). This indicates a **high potential for negative impacts on mental health**, especially in countries with high usage hours.
4. The higher the usage, the higher the conflicts
5. **The majority of respondents** were not low users, but **moderate/high users**, and more than half had been affected by the conflict.

Results by Academic Level

Stacked Bar: High Conflict Flag by Usage Category
(2)

In the first quarter, social media addiction among university and high school students was high and led to social conflicts

1. **High school** students were the respondents most affected by high conflict, even at moderate usage levels.
2. **Undergraduate** conflict was high at high usage levels, but more balanced at moderate usage levels.
3. **Graduate** conflict was still significant, but more controlled than at the high school level.
